Special Instruments –

for Hand Surgery
Our core competence is hand surgery, a field where we can offer you much more than just standard treatment solutions for, say, distal radial fractures. Many of our products are intended to help you to achieve outstanding results in difficult, non-everyday situations as well. Products such as our ulnar head prosthesis (UHP) or the Flower Plate for mediocarpal partial arthrodesis (4-corner fusion) are excellent examples of this.

Our objective is to simplify hand surgery interventions through intelligent system solutions, helping you to achieve the best possible results in the interest of the patient. Working in close cooperation with well-known authors and their teams, we have translated new ideas into innovative products that are consistently being developed further in an ongoing process. The result is a wide range of high-quality systems that impress with their clever design along with easy and safe handling.

And what’s more, we have never lost sight of the economic perspective and service needs of our customers.

We consider ourselves as a true partner – to be relied upon for routine tasks and special challenges alike.

Hand surgical interventions nowadays request more than just basic instruments. Besides indication-related systems the need for special products containing supporting functions is more and more increasing.

However, the necessity of those products is often underestimated. Therefore we set our target to offer easy-to-use instruments and systems in this meaningful field.

Thus we for example provide self-retaining wound spreaders to grant autonomous and unaltered exposure of small access openings or components to achieve intraoperatively the best possible fixation of the hand.
In reconstructive surgery, filling bony defects is a frequent necessity. To this end, the use of autogenous, well vascularized spongiosa still represents the so-called “Golden Standard”.

The iliac crest certainly is the most preferred donor site, given the very high quality of bone grafts harvested there. And even though the process of grafting bone material from the iliac crest region is a very simple operation in itself, complications are nonetheless common, with patients complaining about persistent pain and secondary hemorrhaging being a frequent side-effect.

For this reason, we have developed an instrument that greatly facilitates iliac crest bone grafting and, thanks to the special and simple surgical technique, prevents painful scars and nerve damage at the same time.
To position the mill correctly, an approx. 4-cm-long skin incision is made 2 to 3 cm below the iliac crest and at least 2 cm dorsally to the antero-inferior iliac spine. This is followed by careful dissection of the hypodermis to prevent damage to the nerve branches with their irregular paths. Blunt dissection with a periosteal elevator is then used to keep the outer muscles of the iliac wing apart.

The guide tube is directly applied to the bone and its teeth are driven in a little with a mallet to prevent the guide sleeve from slipping away. The hollow mill is then inserted into the guide tube and moved forward by continuous handle rotation. As soon as resistance is felt to weaken, the cutter has cut through the opposite corticalis.

The bone cylinder remains in the guide tube and is subsequently removed with the tamper.

Hand Arthroscopy System

Where injured joint structures of the carpal region require treatment, wrist arthroscopy has established itself as a surgical procedure with a comparatively low rate of complications in recent years.

For this reason, we have developed a system that allows the surgeon to place the patient’s hand in the best possible position horizontal or vertical for the arthroscopic task at hand.
Vertical positioning (with hand immobilizer)

Vertical positioning (with finger extension sleeves)

Horizontal positioning (with hand immobilizer)

Following post-traumatic or degenerative arthritis of the wrist rescue operations such as partial mid-carpal arthrodesis after excision of the affected carpal bone may often be the last resort to relieve the patient’s discomforts. However the extraction of the bone is not easily carried out and sometimes requires a considerable expenditure of force and holding effort.

Specifically for fixation and extraction of the carpal bone, we have developed the CarpalStick – an instrument which gets into the structure of the bone like a corkscrew.

Thereby, via the T-handle large forces can be transmitted into the threads of the instrument. To ensure patient’s safety and to grant best possible performance of the instrument this single-use article is offered sterile packed.
Following careful stabilization of the carpus, the affected carpal bone is exposed.

Paying due regard to the soft tissue situation, the CarpalStick can now be drilled into the bone at right angles to the bone surface while maintaining a uniform movement.

Once the affected carpal bone has been properly exposed, the extraction process can be started.

Using bone holding forceps, the extracted bone piece is removed from the CarpalStick for subsequent disposal.

In orthopedic and traumatologic surgery, it is often necessary to insert, shorten and subsequently remove Kirschner wires.

Also, it is usually important for the surgeon to be able to insert K-wires single-handedly because the other hand is needed for manipulating tissue, for example.

For this reason, we have developed the Vickers Easidriver™ – an instrument that simplifies the guiding of Kirschner wires as it can be easily operated single-handedly.
The wire is safely grasped with a gentle adduction of the thumb and is then screwed in or out with a simple rotational movement of the forearm.

Abduction of the thumb opens the Easidriver™ and allows fast adjustment of the appropriate length of the wire.

The handles feature bending devices for different wire diameters.
The implantation of Kirschner wires rarely means that the wire is inserted fully. To shorten it to the correct length, however, considerable force must usually be applied. This is exactly where our EasyCut comes in. Thanks to its special design, wires with a diameter of up to 3.0 mm can be cut with little effort.

Since the handle has no sharp edges and incorporates no screws, the instrument can be handled conveniently with no risk of injury.

The removable TC hard-metal cutting inserts can be replaced easily, no special knowledge required.

In hand and traumatologic surgery, it is essential to ensure that small access openings are reliably kept open throughout the intervention.

Moreover, the surgeon must often be able to perform the operation without the help of an assistant (whose task is to keep the wound open), especially in emergency surgery.

For this reason, we have developed the Vickers wound spreaders. They are ideal for keeping small access openings perfectly open, can be operated single-handedly and adapt themselves automatically to wound size.
Vickers Low Profile 1

Due to the superior properties of the materials from which it is made, the KLS Martin Fixation Hand has proved to be an excellent device for intraoperative fixation of the hand.

This lead fixation hand can be quickly and easily bent in any direction. What’s more, it can just as conveniently be returned to its initial form without causing fatigue in the material.

This allows the hand to be operated on to be optimally fixed in place as required by the situation and in accordance with the surgeon’s needs.

Especially where scaphoid fractures are concerned, correct placement of the wrist in extension or flexion position has an important influence on the surgical result.

Our wrist positioning device has been developed with a view to provide a better alternative to the conventional method of placing the wrist on a stack of folded textile cloths.

This device offers the surgeon stable fixation of the wrist during the operation. Whether with its palmar or dorsal side, the wrist can be conveniently placed on the device in overextended position to give the surgeon a better view of the opened wrist and the radius during the operation.
